

THE FORMATION OF THE SCIENCE OF PHYSICS THE GOAL OF TEACHING THE BASICS OF

Kunnazarov Abbaz Biysenbayevich

Nukus "School of Temurbeks" HAL is a physics teacher

Annotasiya: *The article Physics science students by deep learn, to teach the system the purpose of the formation of its sections and about the problems of teaching the science of physics through to tizimlashti and goals to the person directed the education of the young intellectual development and capacity development is dedicated.*

Key words: *Virtual, physical, intellectual potential, virtual laboratory, scientific research, creative projects.*

Physics is the science by the students of deep study for work training system the purpose of the form of the teacher the main tasks of one.

The goals of the science of physics teaching the following to be arranged it can be.

- Virtual physics.
- Creative projects.
- Programming languages physical simulyator create.
- Scientific research.
- Reviews

Physics teaching goals come out students for assignments shall be formed. The above educational purpose out increase to teacher education of the rebuild. Virtual physics lessons in differential education on the basis of readersng to the person directed to to fit the development of the intellectual, which comes salohiyatlarini aimed at plans should be made.

The reader virtual physics of deep study also pedagogical software environment on the topic of a new project to create a programming language to create a program on the basis of physical model qonu simulyator and scientific – creative to work it is necessary to be.

Physics is the science of teaching the system the purpose of oddiydan complex is directed. Virtual physics educationalrning the lower level of thinking suited comes. Creative projects and programming languages physical views simulyatorlar creating readers to fit the mid-level of thinking and cognitive development comes. Research readers thinking and intellectual development of high savinyasi corresponds to. Educational so to achieve the results that you need them in a high level thinking to high intellectual ability physics on the science of the development of the disabled, the development of scientific research skills to achieve it is necessary to.

This here of physics science teaching muamcost and purpose to tizimlashti through to the person directed the education development of the age, intellectual capacity, boosting it.

Which of the country's intellectual potential is high, and in those countries developed will be.

Physics is the science of teaching, the goals included: virtual physics, creative projects, programming languages, physical simulyator to create, scientific research, like the course it is

important to remember school physics concepts, but not the physical law and the formula of the analysis, the physical law of the practical application on virtual projects, create new simulators of the program structure and physics researchers in the field of scientific skills to develop is necessary.

Physics is the science of teaching and also to the person directed education, the development of local job training intellectual capacity to develop in order to shajara a structure has which complex educational organizational system and the classification to the creation of an important role in it.

This, which describe the purpose of education physics teacher's lesson of the organization to the complexity of teaching with the goal of radically new stages and levels of the organization necessary to creates opportunity.

This, which describe the purpose of education technology education within the framework of mutual connection shajara a system.

The teaching of physics which describe the purpose of educational research issuedng core constitute it.

The teaching of physics which describe the purpose of education of the person the reader thinking skills with different levels of development will be directed. Student science study for the disabled logical development stream how to work at the pedagogical level agreement. Differential stream approach on the basis of a disabled student a lesson tactic that is suitable to the level of required improvements will be.

The teaching of physics which describe the purpose of education of radical significance in the following table are listed.

Physics to know the level of	The definition	Of the teacher's task the	Student the task of
Virtual physics	Physics department and to the subject on teaching software tool is selected	Software tools using the physical act of a show makes it explains, teaches	Simxon on the basis of physical law learns, knows the content understands virtual physics perception makes.
Creative project	Physical azerbaijanis these large objects as properties determine the physical law of the implementation and providing project to create	The reader to co according to project plan explains, teaches physical views offer tushu feature provides comments, designing basics teaches you	The software tools that reflect the real opportunities based on physical one of the largest characteristics based on physics of the law in the object properties on the basis of the virtual laboratory of the creation of
Programming in the language of physical simulator to create	Physical law visual show which programming language simulator program to create	student's intellectual potential is the level of development the plan was made	Physics, and programming in the field of capable, who are the students to the subject suitable physical the process of visual demonstrasiyasion simulator project and the program of creation of the

Scientific research	of "intellectual potential of the state of the wealth of the state of the future" is the slogans school starts	Students between the intellectual potential of the most high the some of they you identify them and the referat, coursework diplomawork as assignments will be given.	Well-known physical scientists, life, physical discoveries in the history of physics with modern achievements in the field of scientific research workers, independent, and teacher guidance involved there are
reviews from	Readers in the study of physics on the interests of the development dynamics based readers intellectual salohiyatlarini the development of a directed system of valuations worked out to be need		

In the table outlined are each a stage from the previous stage is based on. For example, virtual physics stage school physics textbooks is based on knowledge. The main purpose of school reader the entire body when he graduated with physics in the field of scientific work hoxish be able to deal with should you. The reader, when he graduated school "great physical I am a scientist" that's the goal to achieve is necessary.
