Annotation: *The most effective way of tackling environmental issues is firstly to understand the importance of it and deeply digest the future dangers that can come from it. Being involved in this issue, I decided to write an article regarding the environment.*

Keywords: *improvement, biodiversity, humanity, pros, necessity, sustain, and comprehend.*

“Environment exists with or without humans but humans are alive with environment” (Prince EA, Environment, pp. 5-6).

Unless we define the deep meaning of the word ‘Environment’, we are just not able to deal with it simply. Since there are some written and felt evidences that the word ‘Environment’ is closely linked with the word ‘Nature’, which is itself as complicated as the former term. However, most of us consider these couple of words quite easy to comprehend, which is fairly untrue. These are not simple words with sole meanings. In fact, dictionary definitions regarding these terms are just parts of the entire meaning, as both words continuously change their centered meaning over time as societies and life change and both the mentioned things are undeniably and greatly necessary for people themselves.

We have many that we have not understand yet, and we are still unaware of why some birds of insects, for instance, set their nests at the same place and regardless of time and geographic positioning they are at, they come back to the exact location. This kind of questions are remaining unknown for us.

A. A. Goyi, N. M. Sher Mohammad and K. M. Omer cites in their work concerning environmental issues that while the word ‘Nature’ refers to the entire existence on the planet of the Earth, the word ‘Environment’, on its step, refers to the existence free of humanity in the nature with all natural surroundings.

Due to the several factors in anthropogeny terms that the environment we are living in has been under the significant influence of humanity, surely for negative. Here, what can be seen and concluded that the society we are living in has enormous effect on the environment and nature our societies exist. As we see what is happening around us, it is easily and clearly seen that each field of life has been impacted by people: from water and air, which are suffering from contamination, to forests under the threat of inexistence

leading to the following big issue of life- climate change. All of the mentioned problems are stemming from the disobedience of humans and in-born consideration of some which refers to being boss to the world we are living in and no other species has the right as humans.

What can make one upset is this is not all. Floods, earthquakes, storms, forest-fires, tsunamis and drought are the following problematic situations being caused by the phenomenon of not treating the environment as properly as most of our millennium ancestors did. In 2006, for example, one of the largest, in the history, and the largest in last 40 years, earthquake occurred beneath the Indian Ocean causing unimaginable damages in social, environmental, political and economic terms. The diameter of the natural disorder was so wide and the rate of it was 500 miles per hour and 15 minutes earthquake was experience in most eastern countries of Asia including Thailand, Singapore, India and Sri Lanka which were those who suffered from the thing more that others. The consequence of this was the death of 175.000 people and the destroyed buildings.

In conclusion, the more we influence the environment and the nature, the more we suffer ourselves and the upcoming generation is going to be those who suffer a lot more drastically compared to current people even. For tackling the problem, initially we need be able to define what the nature itself is and how to deal with the issues we are facing now.
