*Guliston States University 3rd year English bias*

**Abstract:** *This article examines the role of innovative technologies in teaching a foreign language, the use of effective methods in the classroom and their role in improving the quality of education.*

**Keywords:** *language, multimedia, foreign language, method, modern technologies.*

As we all know, language is a means of communication, communication, an instrument of thinking. The native language for the world's haikiari is their priceless value, the pride of the nation. Language is the consciousness and memory of a nation, its psyche, spiritual and cultural image, national values, as well as its past. The role of language in the development of the nation, state, society is very important, extremely necessary and relevant. As the nation, state, and society develop, so does his love and attention to the language. Progress in public life determines progress in language.

As time progressed, attention to languages grew. Perfect study of not only native, but also foreign languages has become a requirement of the time. In the era of information technology, perfect command of a foreign language has become one of the main requirements for high professional qualifications. It is not by chance that special attention is paid to the study of languages of international communication. The teaching of a foreign language in the education system of the Republic of Uzbekistan, based on a scientific approach, based on the introduction of new information and communication and pedagogical technologies that can fully meet the requirements of the time, is reaching a new qualitative level.

All conditions and opportunities have been created for the comprehensive education of the younger generation, mastering modern knowledge and professions. During these reforms, special attention was paid to the teaching of foreign languages. An important factor in this regard was the resolution of December 10, 2012 "On measures to further improve the system of learning foreign languages". As part of the enforcement of this document, the material and technical base of the language laboratories of secondary schools was strengthened. In such classes, students are taught using modern technologies. Foreign language lessons are also taught from the 1st grade using multimedia. The classrooms have video projectors, a TV, a computer, visual aids and toys. Studying the subject in a playful way with the help of educational video programs, cartoons, as well as pictures, songs and poems will help to better assimilate the educational material. Thanks to this, children learn the spoken language faster and consolidate their knowledge even more through stage performances performed in a foreign language. Today, almost all students know some foreign

language to one degree or another. The vocabulary of first-graders is about 60 words and phrases. Seminars, open lessons and their discussion, held in schools in order to improve the skills of foreign language teachers, make it possible to popularize advanced pedagogical experience.

One of the distinctive features of our time is that with the rapid development of information and communication technologies, special attention is paid to a new approach to the educational process and its organization, using its capabilities. The XXI century is a century of high technologies, and modern youth is walking not only in the spirit of the era, but also in accordance with the progress in the electronic world. Therefore, the education of the younger generation a different approach to the donation process is required. The role of the teacher in the classroom too is changing. The teacher now mainly acts as a guide. The era demands that teachers who strive to keep up with the times be ready to enliven any part of the lesson with the help of ICT.

From the first grades of secondary schools, foreign languages were first used in a playful way, and then as the main academic subject, teaching using ICT tools was defined. In order to adequately defend the honor of the country on the world stage, our youth must, first of all, be able to compete with their foreign peers. And today the competition is conducted in foreign languages. Indeed, the role of modern pedagogical technologies, as well as information and communication tools in improving the quality, effectiveness of training, purposeful organization of exciting games for students is huge. The possibilities of their application are expanding day by day, and technical means are becoming an integral part of the educational process. In order to teach young people a foreign language through a computer, first of all it is necessary that the teacher himself be able to use computer technology professionally. The use of this level includes not only the ability to fully use the existing capabilities of the computer, but also the ability to create new training programs based on it. To become a teacher of this level, every foreign language teacher should work more on himself in the field of modern technologies. Teaching a foreign language using a computer has several advantages over traditional teaching methods. A student studying primarily a computer foreign language will have the opportunity to test four language skills: reading, listening comprehension, writing and speaking. Today, this is possible with the help of advanced applications. It is only necessary to be able to correctly guide the student to learning in this way. In addition, it is proved that when teaching foreign languages using a computer, every rule taught, every word, every unit of the concept is better preserved in the student's memory. Indeed, the rich graphical capabilities of a computer, that is, the ability to transmit information in the form of voice, text and video images, have made learning foreign languages through a computer one of the most effective methods.

The main purpose of the use of modern technologies in the study of foreign languages is to facilitate the easy assimilation of the subject.At the same time, it is important to understand a specific source by ear, express it in speech, understand it by

reading, and also express it in writing. In modern technologies, an important factor is the pedagogical process, the implementation of training based on personality-oriented technologies. This method helps to increase work efficiency. Teachers can spend their free and creative time on self-development.

„ Artificial Intelligence and language learning" B.Skinner shows the importance of the role of the computer in easy language learning. Working with a computer is convenient for working on yourself. When learning a language with the help of modern technologies, students learn to respond to information and can analyze weak, that is, unclear areas of data. Technology is not only unique for modern education, but is also an intermediate resource that implements modern and new education of the future.

One of the modern technologies is the international blackboard. This board connects two concepts, such as memory and proof. The blackboard consists of a virtual screen and diagrams that allow you to teach. The Internet is a necessary resource for teachers of foreign languages. It contains a large number of various approved documents.

The most common of modern approaches today is the use of multimedia mainly in the classroom. Multimedia work of foreign language teachers will have a long stay in a real virtual space, facilitating the study of the communication process, in which a multimedia resource will be even easier to master if it is interesting.

The usefulness of multimedia means lies in the fact that when learning a language, you can watch live games, that is, see pictures, hear sounds and observe the activity of live games. In multimedia approaches, it is easy to evaluate basically one person, since multimedia approaches allow you to learn through games. Consequently, the teacher uses a pedagogical approach to each of his students. He tries to reveal the topic through various actions.

Whiteboards that is, interactive whiteboards were introduced to science by Marty. Interactive whiteboards were originally used to express various types of grammatical exercises, logical expressions. Today they are also called "artificial intelligence". Artificial intelligence software is designed for various purposes. Thanks to such modern technologies, learning a foreign language is much more convenient today.

Conclusion

In conclusion, since we live in the era of the development of information technology, it is necessary to improve the teaching of foreign languages, accessible to all, with reasonable use of these facilities. Therefore, the introduction of technologies, ensuring that teaching methods meet the requirements of the time are the urgent main tasks of scientists and teachers. Training of specialists and their professional development are also relevant. The economic, political, cultural and educational ties of our state with the countries of the world are strengthening, the interest of young people in the life, culture, customs, language of foreign countries is growing. The role of foreign languages in the development of these ties is invaluable.
